

Need help managing your preschooler's behaviour?

Does your child show emotional or behavioural problems such as:

- Temper tantrums
- Disobedience
- Anger & irritability
- Low motivation
- Little remorse
- Little empathy
- Shallow emotions
- Insensitivity to discipline

When a child shows these problems on most days for six or more months, professional help may be needed. Disruptive behaviours become harder to change the older a child gets so seeking help early is important.

What is PCIT?

Parent-Child Interaction Therapy, or **PCIT**, is one of the most effective programs for managing oppositional and defiant behaviours in children 7 years and younger. PCIT integrates attachment theory and behaviour modification techniques to help parents regain confidence in their ability to positively and effectively parent their child.

PCIT is done with both the parent and child present. While the parent interacts with the child, PCIT specialists coach him/her using a bug-in-ear device to give real-time feedback from behind a one-way mirror.

How does PCIT work?

There are two phases involved in PCIT. The first phase is called **Child-Directed Interaction (CDI)**. In this phase, parents are coached to use play therapy skills with their child to improve the quality of the parent-child relationship and increase appropriate child behaviours.

The second phase is called **Parent-Directed Interaction (PDI)**. In this phase, parents are taught to give clear, effective commands and set appropriate limits to increase child compliance.

What are the benefits of PCIT?

Decades of research support that PCIT improves children's behaviour problems and parent's skills, increases compliance, reduces parent's stress levels, and improves overall family functioning. Parents who have completed PCIT report high levels of satisfaction with the program and more confidence in managing their child's behaviours. Learn more about PCIT at: <http://www.pcit.org>

Eligibility & Intake Process

UNSW Parent-Child Research Clinic accepts families with 2-7 year old children with disruptive behaviours including temper tantrums, noncompliance, and aggressive or argumentative behaviour. The clinic specialises in working with families whose child shows limited empathy/remorse, insensitivity to punishment, and low motivation. We also provide PCIT delivered face-to-face with an experienced therapist over the Internet to interested families.

A screening interview will be conducted over the phone to find out whether you and your child may be eligible for the program.

Fees

The UNSW Parent-Child Research Clinic currently provides PCIT treatment free of charge to research-eligible families.

About the Clinic Director

Eva R. Kimonis, Ph.D., is a Professor in the School of Psychology at The University of New South Wales. Her program of research focuses on the development, assessment, and treatment of disruptive and aggressive behaviour.

Dr Kimonis is also an experienced clinical child psychologist. She specialises in parent management training interventions, and specifically Parent-Child Interaction Therapy (PCIT) for young children with disruptive behaviours. She is a certified PCIT provider and Level 1 trainer, as endorsed by PCIT International©. She has developed an enhanced version of PCIT for children with limited prosocial emotions (low empathy, poor motivation, insensitivity to punishment), who are at risk for severe, stable, and aggressive antisocial behaviour.
